

FARM HEALTH REPORT

Generated: May 31, 2026 | Analyst: AgriSense AI

Overall Farm Health Score: 82/100

Farm is in good health with strong temperature stability. Minor nutrient optimization recommended for maximum yield potential.

Category Breakdown

Category	Score	Status
Moisture Index	82/100	Good
Nutrient Balance	78/100	Good
Temperature Stability	88/100	Excellent
Weed Control	80/100	Good

Detailed Analysis

Farm Health Report: Comprehensive Analysis

Date: May 31, 2026

Farm ID: QuackFarm-001

Executive Summary

Your farm demonstrates GOOD overall health status with a score of 82/100. While temperature stability is excellent and moisture levels are good, there are actionable opportunities for improvement in nutrient management and weed control to optimize crop yield and long-term sustainability.

Category Analysis

1. Moisture Index (Score: 82/100 - Good)

Status: Soil moisture levels are within optimal ranges across most zones, with good water distribution from recent irrigation.

Findings:

- Average soil moisture: 65% of field capacity
- Even distribution across monitored zones
- No signs of waterlogging or drought stress

Recommendations:

- Maintain current irrigation schedule
- Continue weekly moisture monitoring
- Adjust if rainfall exceeds 1 inch per week

2. Nutrient Balance (Score: 78/100 - Good)

Status: Nutrient levels are generally adequate, though nitrogen shows slight opportunity for optimization.

Findings:

- Nitrogen (N): 18 ppm (optimal range 20-30 ppm)
- Phosphorus (P): 25 ppm (optimal)
- Potassium (K): 185 ppm (optimal)
- pH: 6.5 (excellent)

Recommendations:

- Apply balanced fertilizer with emphasis on nitrogen
- Consider side-dress application at mid-season
- Conduct tissue analysis in 3 weeks

3. Temperature Stability (Score: 88/100 - Excellent)

Status: Temperature conditions are ideal for current crop development with minimal stress from heat or cold.

Findings:

- Average temp: 22°C (optimal)
- Diurnal range: 8-10°C (stable)
- No extreme temperature events detected
- Humidity well-managed

Recommendations:

- Continue monitoring during forecast heat events
- Current microclimatic conditions are ideal - maintain

4. Weed Control (Score: 80/100 - Good)

Status: Weed pressure is moderate and well-controlled with current practices.

Findings:

- Weed density: Low to moderate in field margins
- Identified species: Common lamb's quarters, pigweed (managed)
- No significant yield threat at current levels

Recommendations:

- Continue current cultivation schedule
- Scout field margins weekly
- Prepare pre-emergent application for next season
- Consider cover crop between rows

Priority Actions

1. This Week: Apply balanced fertilizer with nitrogen emphasis
2. Next 2 Weeks: Monitor crop development and tissue color
3. Mid-Season: Conduct tissue analysis and adjust nutrients if needed
4. Ongoing: Weekly moisture and weed scouting

Conclusion

Your farm is in good health. Implementing these targeted recommendations will help optimize your crop yield and establish sustainable management practices for long-term success.
